

Jason (5.8yrs.) returned to the construction of his cathedral today, focussing on the aspect of lighting. His first impulse was to run the electric lights purchased for this purpose through holes in the roof. After some discussion became obvious that there would be wires running all over the roof and holes in the roof through which the lights would have to be inserted. This was very discouraging for Jason and so I thought it might be of some advantage to see how

the lights and wires in the Resource Centre were handled. I removed a ceiling panel and lifted Jason through so that he could see that there were wires and pipes normally hidden from view, in between the roof and the ceiling.

In the accompanying images we see Jason laying out what will be a false ceiling for his cathedral. Brenda steadies the base of the cathedral while Jason traces it.
